

CoachFI AI

White Paper

AI-supported financial education with accessibility by design and verifiable achievement certificates on Solana Devnet.

Version 1.0 · 13 October 2026 · Public MVP - Adult / US / English / free

Financial confidence should be a habit, not a privilege.

DOCUMENT STATUS

How to read this White Paper

This document describes the public CoachFI MVP, its target architecture, and the conditions for responsible growth. It separates the current product, available evidence, and future plans.

Layer	Meaning in this document
Operating now	The public application and Solana Devnet rewards flow. The project owner confirms that the flow works, and the Rewards page is publicly available.
Independent verification	A specific mint requires a transaction signature, asset address, expected owner, metadata, and the deployed program or standard.
Planned	Teen and Kids modes, PL/EU localization, white-label delivery, mainnet, and regulated integrations remain subject to the stated release gates.

Scope and disclaimer

CoachFI is an educational product. It is not a bank, broker, investment adviser, or issuer of a financial instrument. This White Paper is not financial, investment, legal, or tax advice and does not promise financial outcomes.

CoachFI does not present a token or tokenomics model. Points in the demo are a product mechanic. A certificate records completion of learning; it is not sold with an expectation of profit.

Contents

Sections	Topics
01-04	Executive summary, problem, product vision, learning model
05-08	Solana Devnet, architecture, evidence model, data security
09-12	AI governance, accessibility, business model, measurement
13-16	Roadmap, risk register, team, conclusions
17	Sources and glossary

01 EXECUTIVE SUMMARY

Turning knowledge into everyday action

CoachFI AI turns complex financial topics into short, accessible, and measurable learning experiences. Mila, a clearly identified AI coach, explains one idea at a time, proposes one small action, and supports progress without pressure.

Product thesis

Information alone rarely changes behavior. A user needs a relevant explanation in plain language, a short practice task, a safe next action, and visible progress. CoachFI brings these elements together in a learning loop that works through voice and text.

Value	How CoachFI creates it
Understanding	A 20-40 second explanation, a money example, and a clear definition of the key term.
Action	One exercise or action for today, without shame, countdowns, or artificial urgency.
Proof of progress	Off-chain learning history and an optional achievement certificate on Devnet.
Trust	Sources, AI boundaries, data minimization, explicit blockchain consent, and release gates.

Current state on 13 October 2026

- Public MVP for adults in the US, in English, with a free launch plan.
- An operating Solana Devnet flow in Rewards, with an optional wallet and separate blockchain consent.
- No CoachFI token, certificate sale, marketplace, or promise of financial return.
- Teen, Kids, PL/EU, white-label, and mainnet remain controlled development stages.

CoachFI supports financial agency. It does not replace a licensed professional or make financial decisions for the user.

02 PROBLEM

The gap extends beyond financial knowledge

European Commission research points to both a knowledge gap and limited household resilience. In the 2023 Eurobarometer, 18% of EU citizens scored high on financial literacy and 18% scored low [1]. The 2025 EU strategy states that 49% of people aged 18-65 do not have enough emergency savings for three months [2].

Signal	Product implication
18% with high financial literacy	Education must be practical, repeatable, and easy to understand rather than a one-time content event.
49% without a three-month buffer	Early learning paths should focus on financial safety and habits rather than speculation.
High cost of attention	Sessions need to be short, end with one action, and remain usable through voice.
Unequal access	Text, transcripts, keyboard navigation, screen readers, and reduced motion belong in the product core.

Product boundaries

- No streak penalties, loss mechanics, or guilt for taking a break.
- No promotion of leverage, futures, speculation, or rapid wealth claims.
- No product ranking based on sponsor commission.
- No publication of private financial history on a blockchain.

Opportunity

CoachFI can serve consumers directly and provide a white-label learning module for partners. The durable advantage should come from the quality of the learning loop, accessibility, and verifiable achievement. Blockchain is a supporting layer, not the purpose of the product.

03 PRODUCT VISION

Mila guides and the user decides

Mila is a warm, plain-speaking AI financial coach. She always identifies herself as AI. Users can speak or type, and every spoken message has a text equivalent.

Moment	Experience
Ask	The user describes a problem in their own words or selects a topic from a learning path.
Understand	Mila gives one explanation, one example, and a plain-language definition.
Practice	A short quiz, scenario, or choice checks understanding.
Take one step	One small action that can be completed today without connecting a bank account.
See progress	The product shows milestones and can offer an optional achievement certificate.

Core modules

- Onboarding with goal selection and the option to skip questions.
- Money Health Check based on educational answers, not a credit score.
- Today with one priority action and a low-pressure weekly review.
- Learn with short lessons, quizzes, scenarios, and transcripts.
- Goals with routines, milestones, and progress history.
- Rewards with demo points and optional Solana Devnet certificates.

The interface follows one rule: one primary next step per screen. Other information provides context without competing for attention.

04 LEARNING MODEL

A learning loop that ends in action

CoachFI separates information, proof of understanding, and action. Listening to a lesson by itself is not enough to qualify for a certificate.

Stage	Mechanism	Evidence
1 Context	A user question or goal	Selected topic and the minimum necessary data
2 Explanation	A short Mila response	Knowledge card and review date
3 Practice	Quiz or scenario	Off-chain result and completion rule
4 Small action	One action for today	User confirmation or local completion status
5 Progress	Milestone	Learning history and optional certificate eligibility
6 Reinforcement	Spaced review	Knowledge retention and a later check

Knowledge architecture

Content should be maintained as versioned knowledge cards. Each card records the claim, primary source, jurisdiction, audience, review date, risk level, and approved answer boundary. The AI uses reviewed context instead of an unrestricted knowledge source.

- High-risk content requires human review before publication.
- A change in law or source triggers a new review rather than a silent update.
- Quizzes measure understanding of the lesson, not wealth or creditworthiness.
- Users can see why they received an answer and report a mistake.

05 SOLANA DEVNET

An operating flow with a clear evidence status

CoachFI provides an operating Solana Devnet flow in the public MVP. The Rewards page describes points earned through learning, an optional wallet connection, blockchain consent, and certificate minting on Devnet [4].

Level	Status on 13 October 2026	What can be checked
Product	OPERATING	Public Rewards page, certificate states, mint action, and consent copy.
Devnet flow	OPERATING - confirmed by the project owner	Devnet wallet, eligibility, consent, and the mint action.
Specific mint	EVIDENCE REGISTER ENTRY PENDING	Transaction signature, asset address, owner, metadata URI or hash, program or standard, and transfer test.

Why the distinction matters

Solana Devnet is a development network. Test tokens have no value, and public RPC endpoints are shared and not intended for production traffic [5][6]. An operating interface and flow are valid product evidence. Independent verification of a named mint begins with identifiers that another person can reproduce in Explorer.

Certificate rules

- The certificate records completion of a learning path. It does not prove profit, financial capacity, or a professional qualification.
- A wallet is optional for ordinary learning, and blockchain consent is a separate choice.
- Private answers, scores, and financial details remain off-chain.
- The document does not use the terms soulbound, non-transferable, or Metaplex Core deployed until technical evidence supports them.

06 ARCHITECTURE

Blockchain provides evidence rather than user storage

CoachFI separates the private learning experience from public certificate verification. Ordinary learning does not require a wallet.

Layer	Responsibility	Data
CoachFI client	Voice and text, lessons, quizzes, accessibility, consent	Preferences and session state
AI orchestration	Context, answer rules, sources, refusals	Minimum context and quality telemetry
Learning backend	Accounts, content, progress, eligibility rules	Off-chain learning history and results
Certificate service	Builds minimal metadata, requests signature, records evidence	Pseudonymous achievement identifier
Solana Devnet	Transaction, asset, and public verification	Wallet address and a minimal public record
Observability	Errors, latency, security, audit trail	Redacted logs with defined retention

Issuance flow

1. The backend confirms that a published completion rule has been met. 2. The user sees what will become public. 3. The user gives separate consent and selects a wallet. 4. The service creates a minimal record. 5. The wallet signs. 6. The backend records the transaction, asset, owner, and metadata. 7. The user receives an Explorer link and a support path.

Failure design

- Minting is idempotent so a retry should not create a duplicate.
- An RPC failure does not remove learning progress or block course access.
- Changing a wallet does not automatically move learning history.
- Mainnet operations require separate key management, monitoring, audit, and incident response plans.

07 EVIDENCE MODEL

Every certificate should be reproducible

The certificate matters only when an independent reviewer can reconstruct the evidence chain: which rule was completed, who consented, what became public, and how the record can be checked.

Evidence field	Publication requirement
Transaction signature	A public Solana Explorer link using the devnet cluster and showing a successful transaction.
Asset address	The asset created by the transaction, copied from a machine-readable source rather than a screenshot.
Expected owner	The wallet selected by the user, compared with the post-transaction state.
Metadata	Course title, rule version, date, issuer, and URI or hash, without quiz scores or financial data.
Program or standard	The program actually invoked by the transaction. Name the technology only after verification.
Transfer behavior	A separate technical test before any claim that the asset cannot be transferred.
Product trace	Application version, completion rule ID, and issuance time stored off-chain.

Minimum public evidence package

A DEVNET_PROOF file or public panel should contain the date, environment, release or commit, transaction, asset, owner, metadata URI or hash, program, state snapshot, and result of an independent RPC read. Solana exposes transaction lookup and signature verification, and Explorer supports the Devnet cluster [6].

A missing field means unverified, not broken. This distinction preserves the confirmed product status while making the limits of the public audit explicit.

08 DATA AND SECURITY

Private by default and public only with consent

CoachFI uses purpose limitation, data minimization, accuracy, storage limitation, and security as design principles drawn from Article 5 of the GDPR [7]. This is a product direction, not a claim of formal legal compliance.

Remains off-chain	May become public after consent
Health Check answers and conversation history	Public wallet address
Quiz results and personalization rules	Minimal certificate identifier
Goals, amounts, routines, and accessibility settings	Learning path and completion date when they reveal no sensitive information
Contact data, support requests, and reports	Technical metadata required for verification

Controls required before scale

- Separate blockchain consent that explains permanence, public visibility, and wallet-address implications.
- No request for a seed phrase, private key, bank login, or full account number.
- Encryption in transit and at rest, role-based access, secret rotation, and an audit trail.
- Retention defined by purpose. Account deletion must not imply that a public blockchain record can be deleted.
- Incident response, backups, recovery tests, and a responsible vulnerability reporting process.

Threat model

Priority scenarios include account takeover, transcript leakage, prompt injection through source material, unauthorized minting, duplicate certificates, an incorrect owner, wallet phishing, and sensitive data in logs. Each scenario needs a named control owner and a regression test.

09 AI GOVERNANCE

Transparency boundaries and correction

Users should know from the start that they are interacting with AI. Article 50 of the EU AI Act establishes transparency duties for systems that interact directly with people, with relevant duties applying from 2 August 2026 [8][9].

Risk	CoachFI control
Incorrect or stale answer	Versioned knowledge cards, sources, review dates, and regression tests.
Advice instead of education	Approved answer patterns, refusal of recommendations, and referral to a licensed professional.
Hidden automation	A persistent Mila AI coach label and a boundary reminder for high-risk topics.
False confidence	Uncertainty language, clarifying questions, and a visible explanation of why the answer appeared.
No correction path	Error reporting, triage, versioned correction, and notification where users may be affected.

Mila boundaries

- Mila does not select a stock, fund, loan, card, insurance policy, or other specific financial product.
- Mila does not forecast guaranteed returns or use time pressure.
- Tax and legal content requires a jurisdiction, a source, and an appropriate limitation notice.
- For financial distress, Mila offers neutral safety steps and appropriate help channels instead of a product recommendation.

Publication gate

Each new content category requires subject-matter, legal or regulatory, privacy, security, accessibility, and editorial review. PL/EU content needs its own source set. Translating US material is not sufficient.

10 ACCESSIBILITY AND YOUNGER USERS

Voice first does not mean voice only

CoachFI uses WCAG 2.2 AA as its quality target [10]. Every critical path should work without sound, without a mouse, and at increased text size.

Need	Requirement
Vision	Screen-reader structure, clear control names, text summaries for charts, and high-contrast support.
Hearing	A transcript for every lesson, live captions, and visual status information.
Motor	Full keyboard support, targets of at least 44 px, gesture alternatives, and no animation with reduced motion.
Cognitive	One decision per screen, plain language, predictable navigation, and no penalty for taking a break.

Teen and Kids require a separate release gate

The launch scope is Adult / US / English. Teen and Kids modes are planned. Kids requires a parent-created profile, pre-approved content, no open AI chat, no advertising, no purchases, and no notifications directed to children. Certificates should be issued to a parent or guardian account.

- Before a pilot, complete child-safety, privacy, legal, and local age-consent review.
- Avoid loss mechanics. A learning pet never becomes ill, dies, or loses rewards because of absence.
- Keep children's sessions short and lead to a break. Screen time is not the condition for a reward.
- Usability research includes blind and low-vision users and people who use assistive technology.

11 BUSINESS MODEL

Educational value before monetization

The revenue model should support trust in the learning experience. The initial product remains free. Later revenue layers should be tested openly and kept separate from educational decisions.

Channel	Offer	Release condition
B2C	Free core with possible paid programs or learning support features	Evidence of retention and value without dark patterns
B2B2C white-label	Programs for communities, educators, and organizations	Pilot, data isolation, service levels, and clear administrator roles
Partnerships	Content or offers in a separate and clearly sponsored area	No commission-based ranking and no placement in Kids or Teen
Ecosystem	Technical support, grants, and infrastructure collaboration	No sponsor control over learning criteria

Go to market

- Use the founder's education community as the first distribution channel and source of user interviews.
- Run narrow pilots with one audience and one learning outcome before broad deployment.
- Start white-label delivery only after defining data roles, content quality, and support responsibilities.
- Publish case studies with methods and limitations rather than registration counts alone.

Claim discipline

Project materials cite 12,000 clients and 120 planners on the side of a prospective partner. These figures are not CoachFI traction. They should not be presented as product users without independent evidence and an active pilot.

12 IMPACT MEASUREMENT

Measure learning and action rather than vanity metrics

The CoachFI north-star metric is weekly users who complete at least one real educational action or lesson. It links product use with value and does not reward time spent in the application by itself.

Area	Definition
Activation	The user completes onboarding and a first small action or lesson.
Learning	Pre and post change, answer retention over time, and correctly completed scenarios.
Habit	Return and action without streak pressure, plus the use of optional reminders.
Accessibility	Completion with keyboard or screen reader, focus errors, transcript use, and reduced motion.
Safety	Refusals in risk categories, reported AI errors, data incidents, and correction time.
Devnet	Mint success rate, confirmation time, duplicates, owner match, and evidence-register completeness.

Experiment standard

Every pilot defines its hypothesis, population, events, measurement window, and decision rule before launch. Reporting includes attrition, missing data, and accessibility segments. CoachFI does not claim an improvement in financial outcomes without an appropriate study design.

- Do not optimize for more time in the app without an educational reason.
- A certificate measures completion of a rule, not the quality of later financial decisions.
- Partner reach and waitlist size remain separate from active product use.

13 ROADMAP

From an operating Devnet flow to controlled scale

The roadmap is stage-based. Progress depends on evidence of quality, safety, and usability rather than date alone.

Horizon	Outcome	Gate
Now October 2026	Public MVP and operating Devnet flow; publish one complete transaction and asset example	Reproducible Explorer evidence and an issue register
Q4 2026	Stronger achievement rules, metadata, optional wallet, and continued Mila development	Security, content, consent, and accessibility review
Q1 2027	Narrow white-label pilot	Data agreement, baseline, success criteria, and support model
Q2-H2 2027	Country-aware content, staged localization toward 32 languages, and exploration of regulated partners	Sources by jurisdiction, legal review, and translation quality evidence
Later	Consider mainnet	Technical audit, cost model, key management, privacy review, legal review, and incident plan

Decisions the roadmap does not make

- It does not assume a CoachFI token or the sale of certificates.
- It does not name a deployed NFT standard before implementation evidence is public.
- It does not launch Kids or Teen without separate content, privacy, and safety validation.
- It does not move educational data on-chain in pursuit of full decentralization.

Each stage should end with a documented decision to scale, improve, or stop, supported by the evidence collected during that stage.

14 RISK REGISTER

Risks, controls, and release gates

CoachFI combines finance, AI, personal data, younger audiences, and a public blockchain. Controls for these risks belong in the product plan and must be assigned to accountable owners.

Risk	Control	Gate before scale
AI error or advice	Knowledge cards, refusals, tests, human review	Regulatory and quality review
Data disclosure	Minimization, log redaction, separate consent	Privacy assessment appropriate to scope
On-chain permanence	Minimal metadata and preview before signature	User testing of the consent explanation
Wallet phishing	No seed phrase request, clear domain, owner verification	Threat model and security test
Unsupported claims	Evidence register and claim owner	Transaction and asset before verified language
Kids and Teen	Parent controls, closed content, no ads or open AI	Legal, child-safety, and accessibility review
Provider failure	Service abstraction, text fallback, data export	Continuity plan and recovery test

Trust gate status

This White Paper is rated CONDITIONAL / AMBER. It is suitable for discussion and presentation while it keeps the current Adult/US/English scope separate from future markets, education separate from regulated advice, and the operating Devnet flow separate from public evidence of a named mint. Legal, privacy, security, and accessibility reviews are required before contractual or campaign use.

15 TEAM AND ECOSYSTEM

Build product evidence and trust in parallel

CoachFI combines educational distribution, product design, AI, and Solana integration. Team roles should remain clear, and missing competencies should be covered through specialist review and partnerships.

Person or area	Responsibility
Dorian Żaczek — Founder	Product vision, education, user experience, distribution, and partnerships through the DORIANOS and ZŁAP TREND ecosystem.
Mieszko — Solana Developer	Wallet and Devnet integration, certificate issuance, the evidence register, and blockchain-flow security.
Roles to add	Legal and privacy review, child safety, accessibility testing, security engineering, and independent learning-outcome validation.

Why Colosseum

CoachFI brings Solana a use case outside speculation: a voluntary and publicly verifiable record of an educational achievement. Ecosystem support can strengthen the mint architecture, standard selection, Devnet and mainnet reliability, and access to pilot partners.

Current ask

- Partners for narrow education and white-label pilots.
- Technical support to select and audit the certificate standard and transfer behavior.
- Mentoring on on-chain privacy, key management, and mainnet readiness.
- Funding conversations after retention, learning outcomes, and complete Devnet evidence are demonstrated.

Financial confidence should be a habit, not a privilege.

16 CONCLUSIONS

CoachFI focuses on practical progress

CoachFI is designed as an accessible educational coach. It helps a user complete a small action and can issue a verifiable completion record when the user chooses that option.

Current strengths

- A coherent loop from question to explanation, practice, action, and progress.
- Mila is clearly identified as AI, with text support and explicit answer boundaries.
- An operating public Solana Devnet flow without making a wallet a condition of learning.
- Accessibility, privacy, and non-exploitative engagement rules are part of the product design.

Evidence required next

Evidence	Next artifact
Specific mint	Public transaction, asset, owner, metadata, program, and transfer test
Learning value	Pilot with a baseline, knowledge retention, and behavior measured over time
Security	Threat model, privacy review, access tests, and incident plan
Distribution	Active users and pilot conversion kept separate from partner reach

With this evidence discipline, Solana can serve as an optional public trust layer for educational achievements rather than a marketing label.

The next action is to publish one fully reproducible Devnet certificate example and connect it to the exact version of the learning-completion rule.

17 SOURCES AND GLOSSARY

Evidence base

Online sources were checked on 13 October 2026. Product status is based on the public application and the CoachFI Brand V6 project materials.

Glossary

Term	Meaning
Devnet	The Solana development network. Test funds have no monetary value.
Transaction signature	The identifier of a signed transaction used for public lookup.
Asset address	The address of the digital certificate or asset created by the transaction.
Off-chain	Data stored outside the blockchain, such as quiz results and learning history.
On-chain	A minimal public record written to the blockchain.
White-label	A CoachFI version delivered under a partner brand with clearly defined data roles.
